
Panels are restricted to the pre-registered canonical window (monthly families +/-24 months; annual families -6..+3) and each panel uses its own y-scale.
Pre-trend tests use the latest clean pre leads before the reference (matching: the pre-registered five-lead window when available; pooled: up to five latest leads per task); gray marks anticipation months when present and amber marks the opening period (t=0, shown but excluded from the pre-trend test). Error bars are 95% city-cluster intervals when available.
