
Panels are restricted to the pre-registered canonical window (monthly families +/-24 months; annual families -6..+3) and each panel uses its own y-scale.
Pre-trend tests use the five clean pre leads before the reference (reference-5..reference-1); gray marks anticipation months when present and amber marks the opening period (t=0, shown but excluded from the pre-trend test). Error bars are 95% city-cluster intervals when available.
